- **Blocked Domains:**

    - On this page users are able to view tables with ID, domain, Is blocked and action with edit functionality and add button.
    - Blocked domains Record will be displayed in the domain list.
    - Users can not add new records in the domain which are blocked.
    - Using sorting functionality users are able to sort the data.

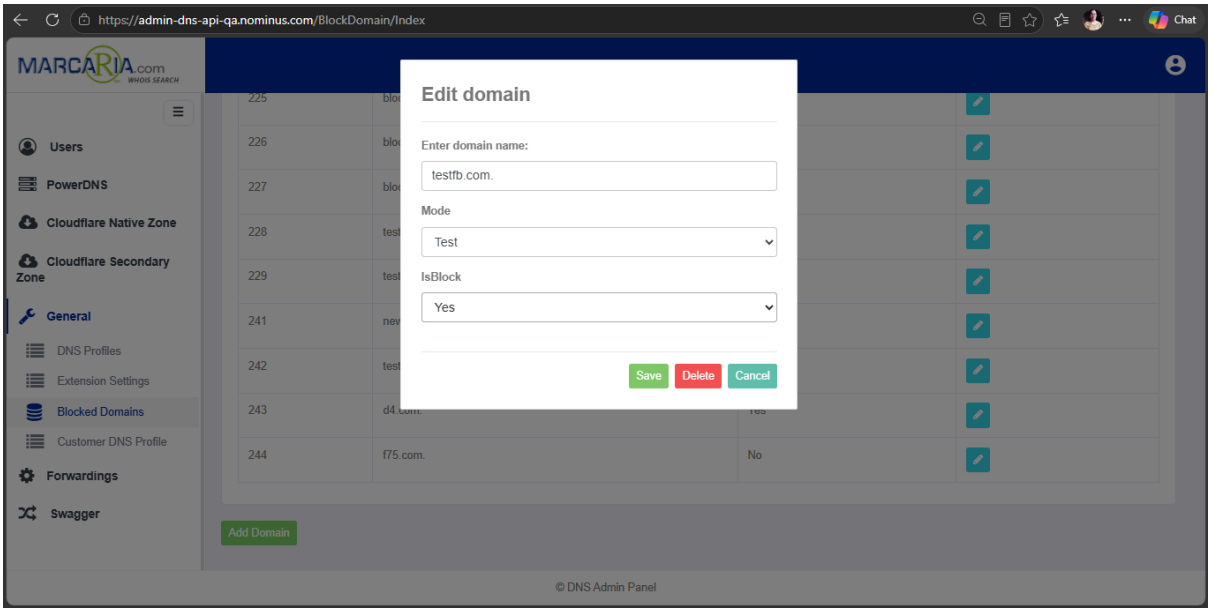

- **Add Button:**

    - Once the user clicks on the add button it will show domain name text area and mode dropdown with live and test option.
    - Here, users are able to block multiple domains in the text area separated each by entering a domain name. i.e. every domain must be in a new line.

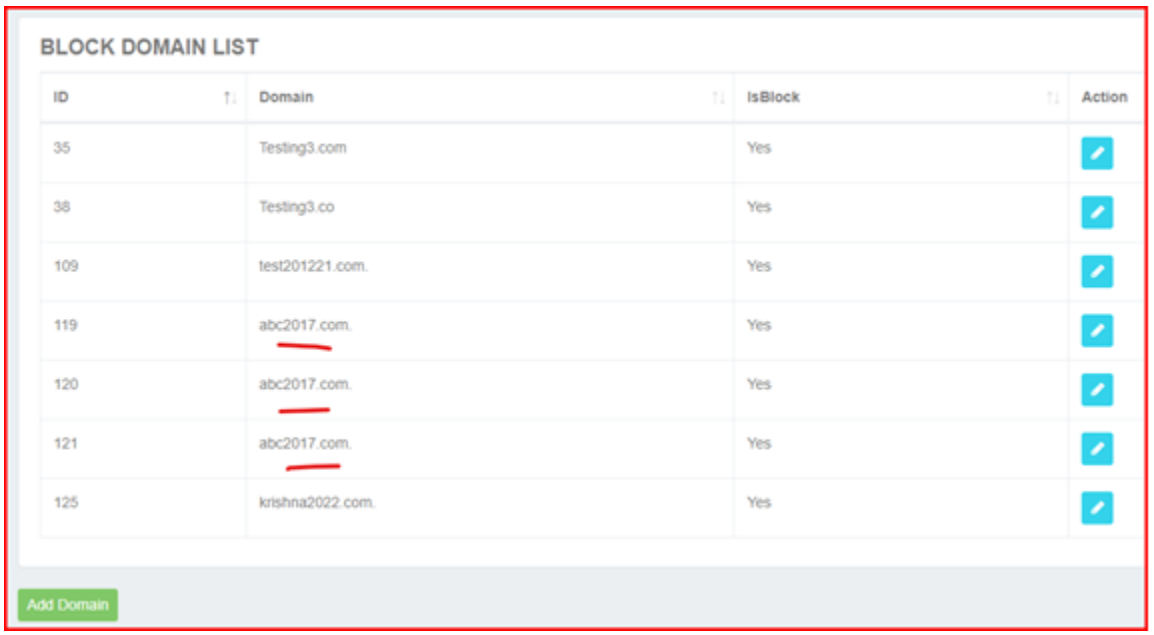

- **Save Button:** Click on save button it will block the domain.
- **Cancel Button:** Click on Cancel button pop will be closed.

- **<u>Edit Icon</u> :**
  - Users are able to click the edit icon from the Action field of the blocked domain page.
  - Users can get the popup with following details..
    - Enter Domain name text area field
    - Mode dropdown
    - Is block dropdown
    - Save button
    - Delete button
    - Cancel button
  - The domain is **unblocked** when the user selects the **No option** from the **Is Blocked dropdown menu.**
  - **Users can add records to the domain only when the domain is unlocked.**

- When a domain gets blocked the first time and then blocks the domain again with the same name, a message should be displayed: “**abc2017 is already in the blocked list”.**

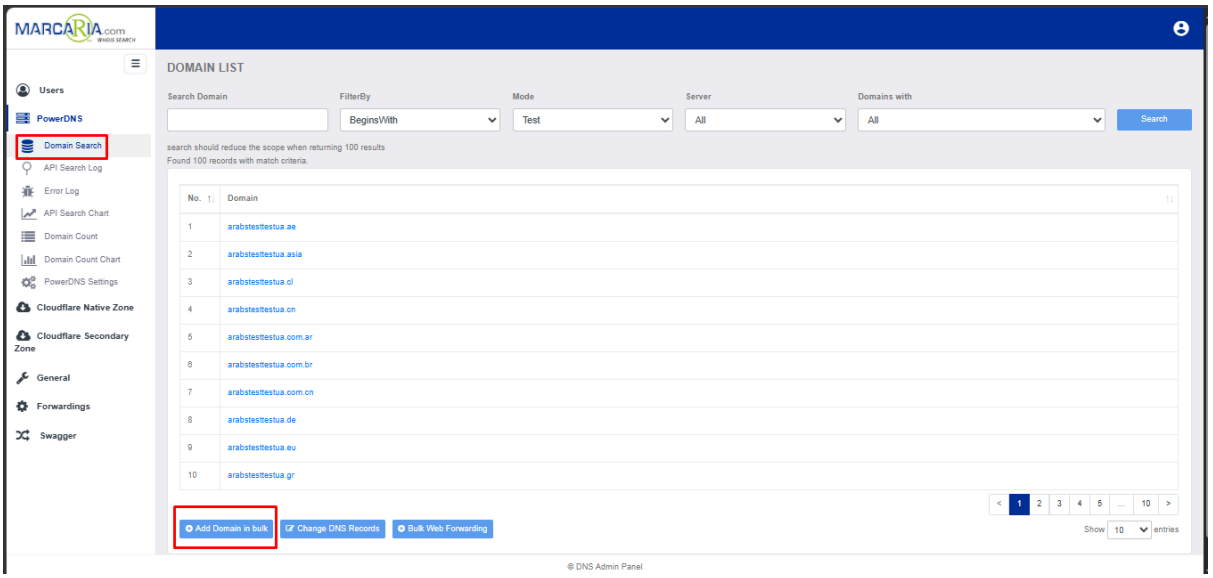

- Email and Web forwarding is allowed in blocked domains.
- **NOTE:** Users need to add (.) dot after the domain name when they are adding it in the blocked domain list.

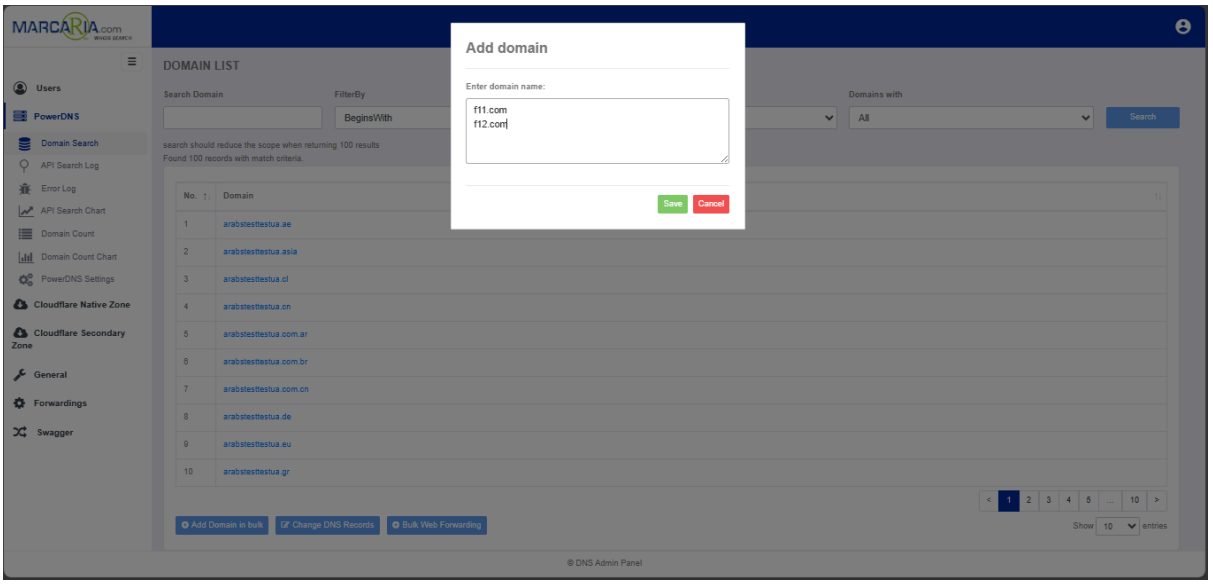

Objective : (New Requirements)

To verify that DNS records cannot be updated when the domain is marked as blocked.

So, here users can click on the PowerDNS module and in the domain search page below one button is shown like add domain into bulk so click that button.

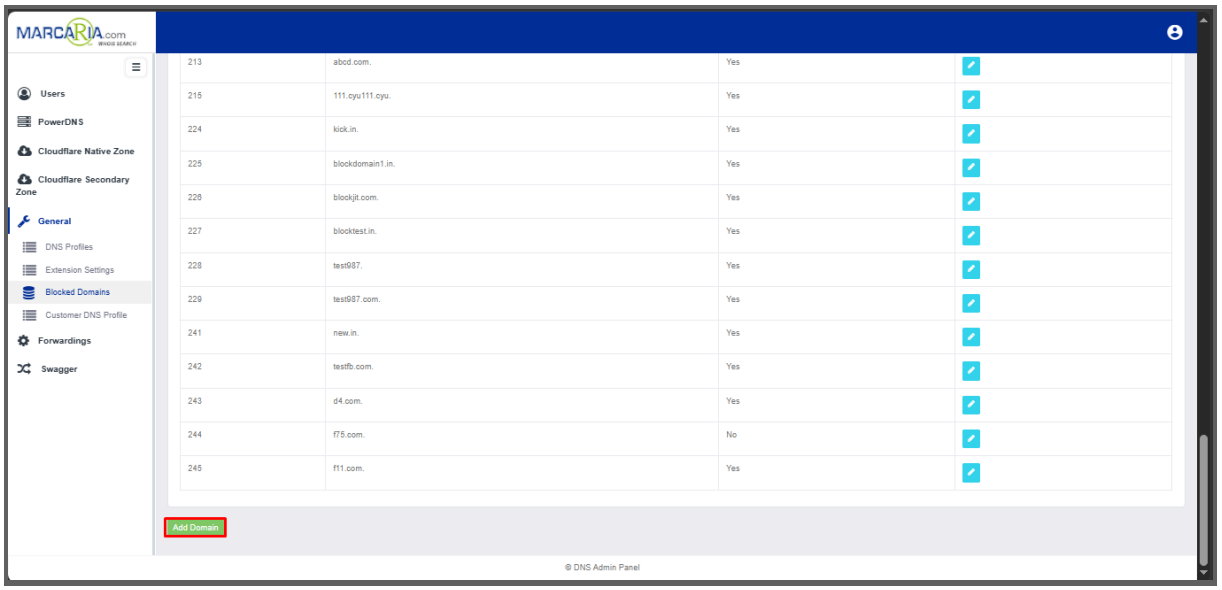

- **<u>Add Domain in Bulk</u> :**
  - When the user clicks on the Add domain in bulk button it will open the popup with textarea ,Save and Cancel button.
  - Here, users can add multiple domains in the text area separated each by entering a domain. i.e. every domain must be in a new line

  - Click on save button it will add the domain in the list.

NOTE: Entered domain name must be unique. If a user entered a name which is already available in the list it will give validation of the conflict domain name.

- Then Click on the General module and click on the Blocked Domains.
- And after that the domain list page is shown in that page below you see the Add Domain button.Click on it.

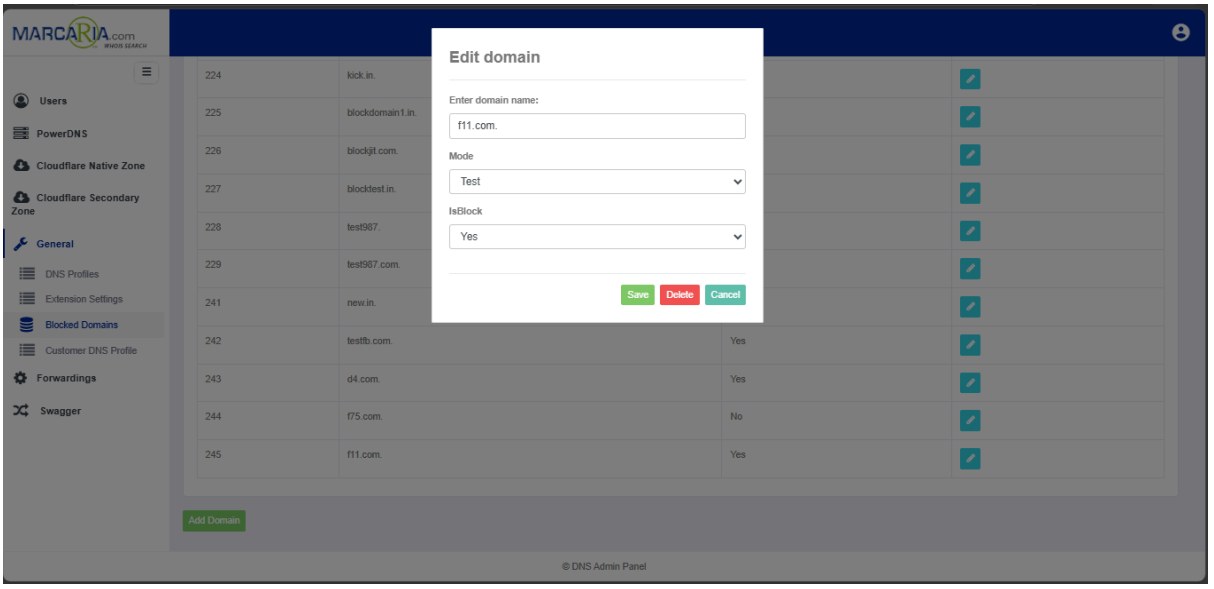

- **Add Button:**
  - Once the user clicks on the add button it will show domain name text area and mode dropdown with live and test option.
  - Here, users are able to block multiple domains in the text area separated each by entering a domain name. i.e. every domain must be in a new line.

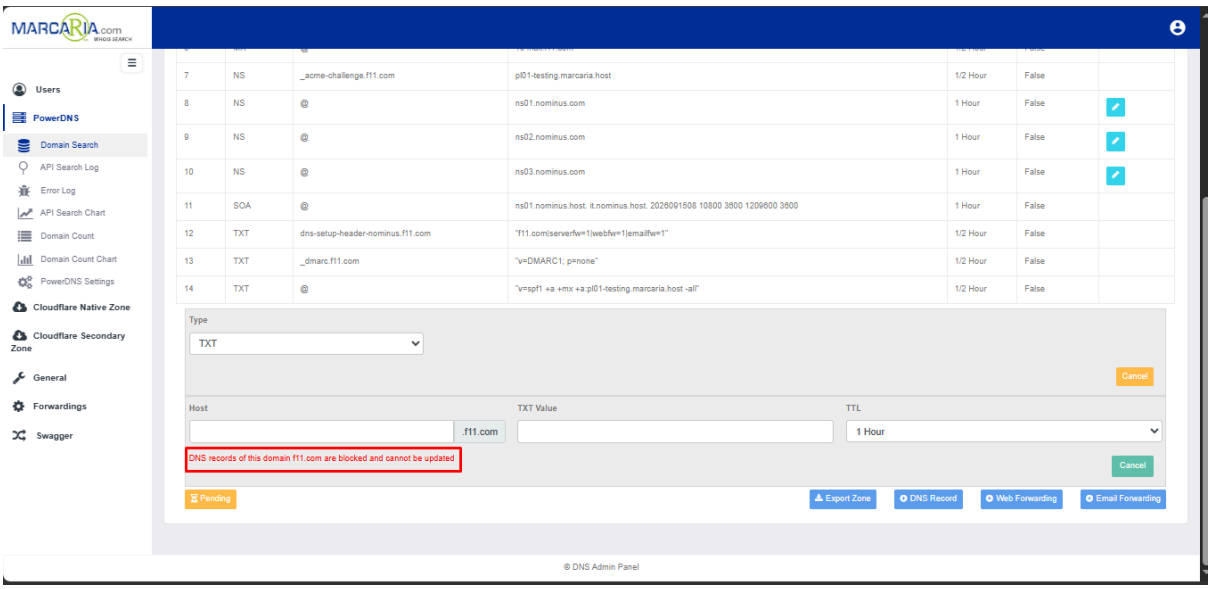

- **Save Button:** Click on save button it will block the domain.
- **Cancel Button:** Click on Cancel button pop will be closed.

- **Edit Icon :**
  - Users are able to click the edit icon from the Action field of the blocked domain page.
  - Users can get the popup with following details..
    - Enter Domain name text area field
    - Mode dropdown
    - Is block dropdown
    - Save button
    - Delete button
    - Cancel button
  - The domain is **unblocked** when the user selects the **No option** from the **Is Blocked dropdown menu.**
  - **Users can add records to the domain only when the domain is unlocked.**

  - Click on save button it will update the domain in the list.
  - Then again go to the PowerDNS module and click on it Domain Search and using filter functionality Search Domain type here your domain name and enter it.
  - Here see your domain then click on it and add the DNS record and select there Type of the record whichever you can add and below you see the error like DNS records of this domain f11.com are blocked and cannot be updated.

Same for the Web Forwarding and Email Forwarding got the error.

- **<u>Delete Blocked Domain</u> :**

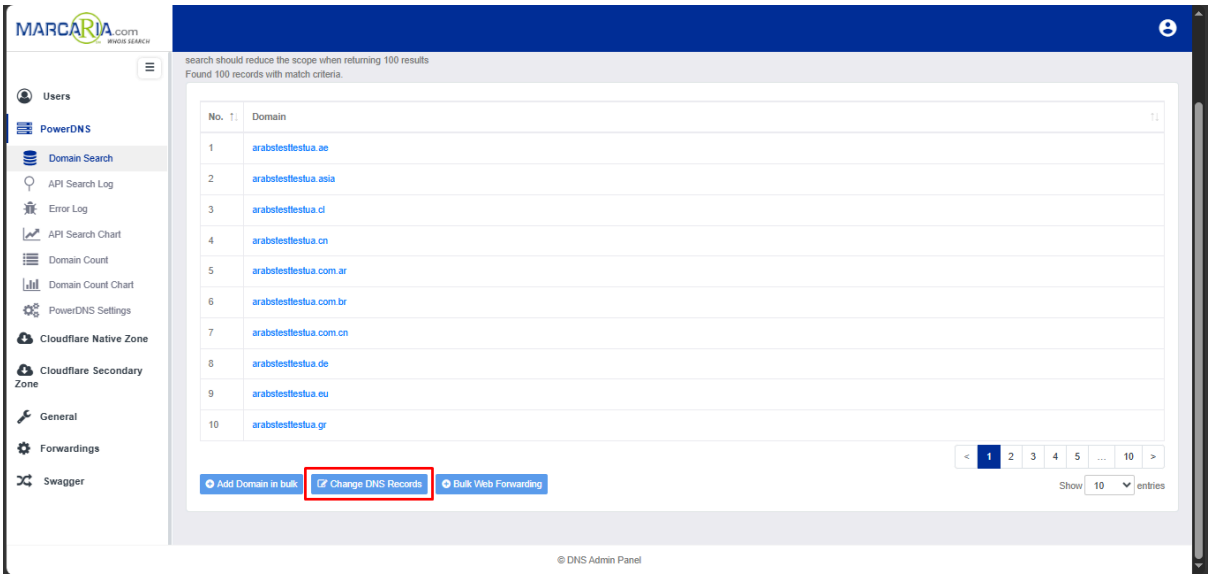

Add a new domain to test the delete functionality whenever the domain is blocked.

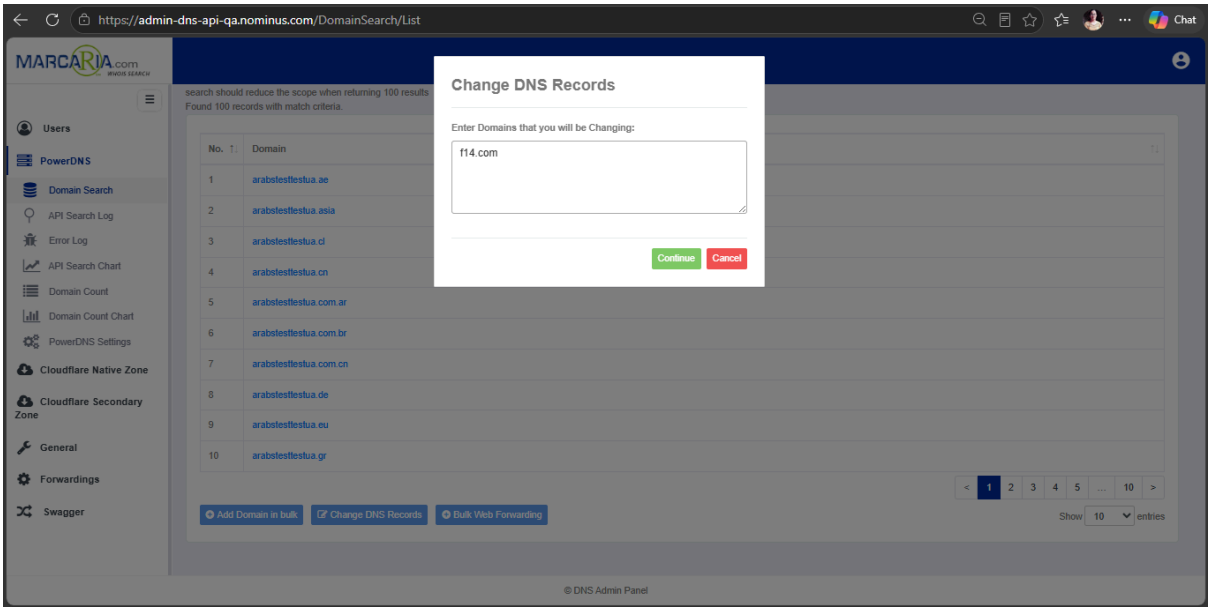

Click on the save button.

Next, click on the general module and click on the blocked domains features. And by the same name add it using the Add domain button and make sure the test mode is Test not live.

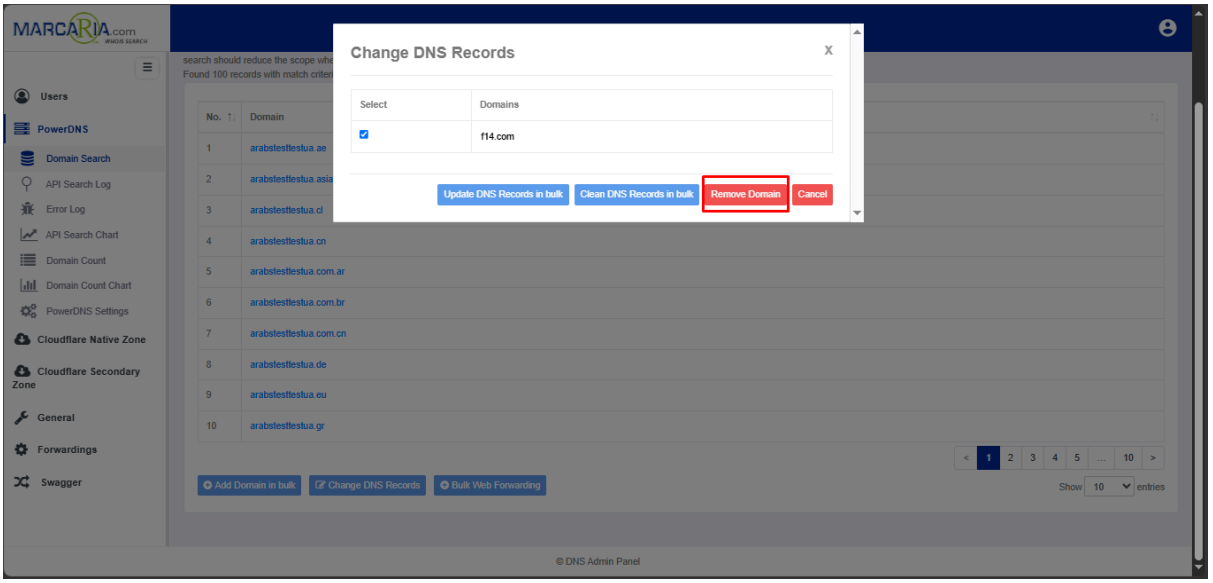

Next, again back the PowerDNS module and click on the Domain Search button and scroll down the page and see the Change DNS Record button. Click on it.

You can see below image like pop up here you write your domain name whichever you can change and click on the continue button.

When you click on the continue button it shown one pop-up like below:

Click on the remove Domain button and see the message like in the below image:

The Domain is blocked so we can’t delete it.
